INSIDE THIS PLAYBOOK

What you'll learn, chapter by chapter.

01 **The 2026 Reality Check** 03
Why 79% of organizations are struggling — and why the window to lead is shrinking fast.

02 **The Cost of Waiting** 05
What it's actually costing you to delay adoption — quantified.

03 **The 5 AI Readiness Pillars** 07
The foundation every successful AI organization builds on first.

04 **The 90-Day Start Framework** 10
A week-by-week plan to get from zero to three working AI workflows.

05 **High-ROI Use Cases by Function** 13
Where AI pays back fastest — marketing, sales, ops, finance, HR, service.

06 **The 7 Mistakes That Kill AI Projects** 16
What the 95% of failed pilots have in common — and how to avoid them.

07 **Governance, Security & Risk** 18
Building the guardrails that let you scale AI safely.

08 **How IMAGENN.ai Helps** 20
Where we fit, what we do, and how to get started.

CHAPTER 01

The 2026 Reality Check

AI adoption has crossed a threshold most leaders haven't noticed yet. The question is no longer *whether* to adopt. It's whether you'll be leading or catching up.

Between 2023 and 2026, enterprise AI usage more than doubled. At the OECD level, firm-level AI use climbed from 8.7% to 20.2% in two years — a 132% increase. Among large enterprises, that number now sits at 55%. In the United States, individual workforce adoption of generative AI has reached 41%, up from under 20% eighteen months ago.

But the headline number hides a far more interesting story — one of winners and losers separated by a surprisingly thin margin.

88%
of organizations now use AI in at least one business function
McKinsey, State of AI 2026

29%
of companies report significant ROI from their AI investments
WRITER Enterprise AI Survey 2026

79%
of executives report facing major challenges adopting AI — up double digits from 2025
WRITER 2026, n=2,400

95%
of generative AI pilots fail to move beyond proof-of-concept
MIT, 2026

THE CORE INSIGHT

Adoption is nearly universal. **Real business value is not.** The gap between organizations running AI pilots and those scaling AI to measurable ROI has never been wider — and it's compounding every quarter.

What's really happening in organizations right now

The data tells a story leadership teams rarely see on their own dashboards. In Q1 2026 alone, global AI investment hit **$242 billion** — more than four times the same quarter a year earlier. Yet **54% of C-suite executives** admit AI adoption is tearing their company apart internally.

Three forces are colliding:

- **Individual productivity is real.** The 40% of employees classified as "AI super-users" in marketing, sales, HR, and support roles are measurably five times more productive than non-adopters.
- **Organizational ROI is not.** 48% of leaders now describe their AI rollout as "a massive disappointment" — and 75% admit their AI strategy exists more for investor optics than for internal guidance.
- **Governance is falling behind.** 67% of executives report their company has suffered a data leak through unapproved ("shadow") AI tools. Only 20% have a tested AI incident response plan.

> *"Layoffs are not a viable AI strategy. The leaders putting in the work to radically redesign operations with human-agent collaboration at the center are the ones compounding their advantage in ways competitors can't replicate."*
>
> — May Habib, CEO & Co-founder, WRITER

Why the window is closing

Researchers recently unveiled a computational approach that reduces AI inference cost by up to 100× while improving accuracy. Within 18–24 months, the agentic AI capabilities available only to Fortune 500 companies today will be accessible to a 10-person business — **at a fraction of the cost**.

When that cost barrier collapses, the moat stops being budget. The moat becomes execution speed and organizational readiness. The companies building strategic foundations now will capitalize. The ones still debating prompt engineering in workshops will not.

⚠ THE UNCOMFORTABLE TRUTH

CHAPTER 02

The Cost of Waiting

Every quarter you delay is measurable. Here's what it actually costs — in productivity, talent, revenue, and competitive positioning.

The productivity gap

Companies successfully implementing AI are reporting **20–40% productivity gains** in targeted workflows, with first-year ROI ranging from 3× to 10× initial investment. Organizations running well-structured pilots are seeing **34% operational efficiency gains** and **27% cost reductions** within 18 months.

Put in concrete numbers: a 50-person knowledge-work team that implements even basic AI augmentation captures roughly **4,000–8,000 hours of recovered capacity per year**. That's the equivalent of 2–4 full-time employees — without hiring anyone.

The talent gap

Here's what leadership teams are still underestimating: **92% of C-suites** are now actively cultivating an "AI elite" layer of high-performing employees. **77% of executives** confirm employees who refuse to become AI-proficient will not be considered for promotions. **60% plan layoffs** for non-adopters over the next 24 months.

Your best people already know this. They're either building AI fluency inside your organization — or they're taking those skills somewhere that rewards them.

5×
productivity multiplier for employees classified as AI super-users vs. non-adopters

6 mo
average payback period for organizations with structured AI implementation

333%
average 3-year ROI reported by enterprises with mature AI programs (Forrester TEI)

40%
of enterprise applications will embed task-specific AI agents by end of 2026 (Gartner)

The competitive gap

Business leaders in Grant Thornton's 2026 AI Impact Survey identified **competitor moves** as the single largest external pressure driving AI adoption. Not customer demand. Not cost savings. **Fear of being left behind.**

Here's why that fear is rational:

- **Customer service** and **eCommerce** are leading adoption — companies in these sectors are responding to inquiries in seconds, personalizing at scale, and operating 24/7 with AI agents starting at $20/month.
- Anthropic's Model Context Protocol — the infrastructure layer letting AI agents connect to any tool — crossed **97 million installs in March 2026 alone**. A significant portion of enterprise software now ships with AI agents embedded.
- SMBs in Canada and the US adopting AI are reporting **22% improvements** in lead-to-meeting conversion from simple follow-up automation alone.

THE SHADOW AI PROBLEM

While leadership teams debate AI strategy in quarterly meetings, **52% of employees are already using AI agents** to do their jobs — often on unapproved, consumer-grade tools. This isn't future tense. It's happening in your organization right now. The only question is whether it's governed or not.

The compounding effect

Unlike previous technology shifts, AI compounds. The organization that implements customer service automation this quarter builds the data foundation for personalization next quarter — which builds the knowledge graph for sales intelligence the quarter after that. Each layer makes the next one easier, cheaper, and more powerful.

The organization that waits doesn't just miss one cycle. It misses the compounding advantage entirely — and each quarter the gap widens faster than the last.

✓ WHAT EARLY MOVERS ARE GETTING

The 29% of organizations seeing significant ROI share four characteristics: **(1)** they connect

CHAPTER 03

The 5 AI Readiness Pillars

Before you buy a single tool, your organization needs these five foundations in place. Skip any of them and you'll join the 95% of failed pilots.

01

Strategic Clarity

A written AI strategy that ties to specific business outcomes — not a "we want to use AI" statement.

02

Data Readiness

Your data is inventoried, accessible, and clean enough for AI to actually use.

03

People & Skills

Leadership commits to upskilling. Teams understand the "why." Fear is addressed head-on.

04

Technology Stack

A minimal, integrated AI toolkit — not 15 disconnected subscriptions creating shadow IT.

05

Governance

Guardrails for privacy, security, human oversight, and accountability — defined before deployment.

→

Assessment First

Score each pillar 1–5 honestly before starting. Fix what's broken before scaling.

Pillar 1 · Strategic Clarity

The most dangerous phrase in AI strategy is "we need to do something with AI." That's not a strategy — it's an anxiety. A real AI strategy answers three questions in writing:

- **What specific business outcome are we chasing?** Cost reduction? Revenue growth? Service speed? Risk reduction? Pick one primary.
- **Which 2–3 workflows have the highest payoff?** Not "all of marketing" — specific repeatable processes like "inbound lead qualification" or "invoice processing."
- **What does success look like in 90 days, 6 months, and 12 months?** With numbers.

Pillar 2 · Data Readiness

Across 12 SMB AI implementations studied in late 2025, the biggest obstacle in 9 of them was **not** the AI tool — it was the messy state of the business's own data. Contact records with duplicates, products with inconsistent tags, customer histories scattered across four systems.

Before any AI initiative, audit:

- **Where does your data live?** CRM, spreadsheets, email, documents, specialty systems.
- **Is it clean?** Consistent formats, no duplicates, tagged correctly.
- **Is it accessible?** Can the AI tools you plan to use actually read it, via API or integration?
- **Is it governed?** Who owns it, who can access it, what's sensitive, what can leave your environment?

Pillar 3 · People & Skills

Boston Consulting Group's research across 200+ AI transformations pinpoints the most important ratio in AI adoption: **10-20-70**. Successful organizations allocate 10% of effort to algorithms, 20% to technology and data, and a full **70% to people and processes**.

That 70% breaks down into:

- **Leadership commitment.** High-performing AI organizations are 3× more likely to have senior leaders actively modeling AI use themselves.
- **Role-specific training.** Not generic "AI awareness" webinars. Specific training for specific tasks: "how marketing uses AI for campaign briefs" beats "what is generative AI?"
- **Psychological safety.** Address fears directly. Explain what AI will augment vs. replace. Make it clear how the organization wins — and how employees win within it.

Pillar 4 · Technology Stack

The mistake: subscribing to 15 AI tools because each promised to "revolutionize" one function. The result: data silos, shadow IT, and subscription bloat.

The fix — for most organizations under 500 employees — is a **minimum viable AI stack**:

Self-Assessment: Score your organization

Rate each pillar from 1 (we haven't thought about this) to 5 (we have this nailed). Total score indicates where to start.

PILLAR	ASSESSMENT QUESTION	YOUR SCORE
Strategic Clarity	We have a written AI strategy with specific outcomes, workflows, and timelines.	___ / 5
Data Readiness	Our key business data is inventoried, clean, accessible, and properly governed.	___ / 5
People & Skills	Our leadership actively uses AI, and our teams have role-specific AI training.	___ / 5
Technology Stack	We have an integrated minimum-viable AI stack — not 15 disconnected tools.	___ / 5
Governance	We have written rules for AI use, data boundaries, and human oversight.	___ / 5

Interpreting your score

Score 0–10 · Explorer stage. Don't buy any AI tools yet. Start with an honest readiness audit and a single, well-chosen pilot. Your biggest risk is spending money on tools your organization can't absorb.

Score 11–17 · Pilot stage. You have foundations but gaps. Focus on closing your weakest pillar before scaling. Run 1–2 narrow pilots with clear metrics.

Score 18–25 · Scale stage. You're ready to move from pilots to integrated AI workflows. Your challenge is governance and scaling discipline, not getting started.

CHAPTER 04

The 90-Day Start Framework

From zero to three production-ready AI workflows in ninety days. This framework has been battle-tested across dozens of SMB and mid-market deployments in 2025–2026.

Phase 1 · Days 1–30 — Foundation

1. **Week 1 — Executive alignment.** CEO, COO, and functional leads agree in writing on: the one business outcome AI is chasing, who owns the initiative, and the budget ceiling for the first 90 days.
2. **Week 2 — Readiness audit.** Run the 5-Pillar Assessment (Chapter 3). Document your top 3 weakest pillars. These become guardrails, not blockers.
3. **Week 3 — Use-case selection.** Interview team leads. List 10 candidate workflows. Score each on: impact (revenue / cost / time saved), feasibility (data available, tool exists), and risk (customer-facing? sensitive data?). Pick the top 3.
4. **Week 4 — Pilot design.** For each of the 3 use cases, write a one-page pilot plan: current-state baseline metric, target metric, tool choice, owner, success/kill criteria at Day 60.

Phase 2 · Days 31–60 — Pilot

1. **Week 5–6 — Tool setup & training.** Deploy chosen tools. Run role-specific training sessions (not generic webinars). Include the actual people who'll use the tool daily.
2. **Week 7–8 — Live pilot with human-in-the-loop.** Run the workflow in parallel with the existing process. Every AI output is reviewed before it reaches a customer or enters a system of record. Track time saved, quality, and error rates daily.
3. **Day 60 — Go / no-go review.** For each pilot: did it hit the target? If yes, move to Phase 3. If no, kill it cleanly — and write down why, so the next pilot is smarter.

Phase 3 · Days 61–90 — Productionize

1. **Week 9 — Reduce human oversight gradually.** For workflows that hit their targets, shift from "review every output" to "review a sample" to "review exceptions." Never go fully autonomous on customer-facing decisions in the first 90 days.
2. **Week 10 — Document the playbook.** For each working AI workflow, write: the prompt/configuration, the data inputs, the handoff rules, the escalation paths, and the metrics being tracked. This is what lets you scale.
3. **Week 11 — Train the team on the new normal.** The pilot team teaches adjacent teams. AI literacy spreads laterally faster than it spreads top-down.
4. **Week 12 — Executive review & next-quarter plan.** Present the 90-day results to leadership with three numbers: time saved, cost/revenue impact, and quality change. Approve the next 3 workflows.

What "done" looks like at Day 90

- ✓ Three AI workflows running in production with human oversight at defined checkpoints
- ✓ A documented playbook for each (repeatable, not tribal knowledge)
- ✓ Measurable baseline → outcome metrics for each workflow
- ✓ A trained pilot team ready to help spread AI laterally across the organization
- ✓ A written governance policy covering data, privacy, and human-in-the-loop rules
- ✓ An approved roadmap for the next 90 days

✓ REAL-WORLD BENCHMARK

A B2B services firm running this exact framework in late 2025 automated lead-qualification email sequences and post-demo follow-ups. Result in 6 weeks: **22% improvement in qualified-lead-to-meeting conversion**, roughly 15 hours/week saved across the sales team, and zero customer complaints during the human-in-the-loop phase.

WHY 90 DAYS, NOT 12 MONTHS

The 90-Day Visual Roadmap

01
DAYS
1–30

Foundation

Goal: Executive alignment, readiness audit, pilot selection, pilot design.

Deliverables: Written AI strategy · 5-pillar scorecard · Top 3 use cases ranked · One-page pilot plan for each.

02
DAYS
31–60

Pilot

Goal: Tool deployment, training, live human-in-the-loop execution, go/no-go review.

Deliverables: Working pilots with daily tracking · Baseline vs. target metrics · Day-60 decision for each workflow: scale, iterate, or kill.

03
DAYS
61–90

Productionize

Goal: Reduce oversight gradually, document, train adjacent teams, plan next 90 days.

Deliverables: 3 productionized workflows · Documented playbooks · Lateral team training · Q2 roadmap approved by leadership.

⚠ NON-NEGOTIABLE RULES FOR THE 90-DAY RUN

One owner per pilot. Not a committee. **Budget ceiling in writing.** $5K–$25K typical for 3 pilots in an SMB. **Metrics before tools.** Never start a pilot without a measurable target. **Kill criteria defined at Day 0.** If you can't define what failure looks like, you can't recognize success either.

CHAPTER 05

High-ROI Use Cases by Function

Where AI pays back fastest — across the seven functions where organizations are seeing measurable impact in 2026.

Marketing

The highest-density AI opportunity in most organizations. Marketing teams with AI super-users are seeing 5× output increases on content production alone.

- **Campaign brief generation** — from product info to first-draft brief in 15 minutes.
- **Content repurposing** — one long-form asset → blog, LinkedIn posts, email, video script, ad copy.
- **Persona-specific landing pages** — AI generates variants for A/B testing at 10× the speed.
- **SEO content scaling** — topical clusters built in hours, not weeks.
- **Ad copy variant generation & fatigue monitoring** — especially impactful on Google Ads and Meta.

Sales

Sales is the function with the clearest revenue-to-AI line. Companies using AI for lead scoring and outreach automation report **20–30% increases in closed-won revenue**.

- **Lead qualification & routing** — AI scores inbound leads against historical win patterns with 80–90% accuracy.
- **Meeting prep briefs** — AI produces a 1-page intel brief from LinkedIn + CRM + web search before every call.
- **Call summaries + next-step generation** — Gong-style transcription + action extraction, auto-synced to CRM.

- **Personalized outbound sequences** — first-touch email personalization at scale.

Operations & Finance

Where AI quietly delivers the biggest cost savings — often without anyone noticing until the P&L reflects it.

- **Invoice & expense processing** — AI extracts, codes, and routes with 95%+ accuracy.
- **Accounts receivable automation** — AI-drafted payment reminders reduced one consultancy's past-due invoices by **35% in 3 months**.
- **Contract review** — key-term extraction, red-flag detection, version comparison.
- **Inventory & demand forecasting** — especially for retailers and distributors.
- **Financial close automation** — reconciliation, variance analysis, board-pack draft generation.

Human Resources

A fast-moving AI function where speed-to-hire and retention improvements compound quickly.

- **Resume screening & candidate shortlisting** — especially for high-volume roles.
- **Structured interview guide generation** — role-specific, bias-reduced.
- **Onboarding automation** — personalized first-30-day plans generated per role.
- **Policy Q&A chatbots** — employees get instant HR answers instead of waiting 48 hours.
- **Pulse-survey sentiment analysis** — identify retention risks before they resign.

Product & Engineering

Developers using AI coding assistants are reporting **30–55% productivity gains** on well-scoped tasks.

- **AI-assisted coding** (Claude Code, GitHub Copilot, Cursor) — boilerplate, testing, refactoring.
- **Bug triage & log analysis** — pattern detection across millions of log lines.
- **Documentation generation & maintenance**.
- **User feedback synthesis** — thousands of reviews summarized into product themes.

Use-Case Prioritization Matrix

Rank your candidate use cases. High-impact + high-feasibility + low-risk = start here.

USE CASE	IMPACT (1–5)	FEASIBILITY (1–5)	RISK (1–5, LOWER=BETTER)	PRIORITY SCORE (Impact + Feasibility − Risk)
Lead qualification automation	___	___	___	___
Customer service deflection	___	___	___	___
Content / campaign brief generation	___	___	___	___
Invoice / AR automation	___	___	___	___
Meeting prep & call summaries	___	___	___	___
Resume screening	___	___	___	___
Internal knowledge Q&A chatbot	___	___	___	___
Contract review assist	___	___	___	___
Your use case: _____	___	___	___	___
Your use case: _____	___	___	___	___

How to use this matrix

- **Impact** — how much revenue, cost savings, or time does this workflow represent annually today?

CHAPTER 06

The 7 Mistakes That Kill AI Projects

95% of generative AI pilots fail to move beyond proof-of-concept. They fail for surprisingly predictable reasons. Here they are — and how to avoid each.

Mistake 1 · Starting with technology instead of a problem

The failure mode: "We should do something with AI." The fix: "We want to reduce customer response time by 40%." Technology is never the strategy. The business outcome is the strategy.

Mistake 2 · Treating AI as an IT project

AI is a **change management initiative**, not an IT deployment. Organizations where IT owns AI alone consistently underperform organizations where business teams own workflows and IT provides guardrails. The 70% of AI success is people and process — not the model.

Mistake 3 · Ignoring data quality

In 9 out of 12 SMB AI deployments studied in 2025, the biggest obstacle wasn't the AI tool — it was the messy state of business data. **Budget 50% of your project timeline for data cleaning** before expecting AI to produce clean outputs.

Mistake 4 · Crowdsourcing strategy from the bottom up

PwC's 2026 research is explicit: AI front-runners follow a **top-down program** where senior leadership picks a few key workflows where AI payoffs can be big. Crowdsourcing produces impressive adoption numbers and minimal business outcomes. Leadership must pick the spots.

Mistake 5 · Skipping the human-in-the-loop phase

AI gets things wrong — sometimes in ways that sound confident and technically correct but are tone-deaf or factually off. Every new AI workflow needs a human review step **for at least the first 30 days**, especially anything customer-facing. Gartner projects that **40% of agentic AI projects will be cancelled by 2027** primarily because organizations skipped governance and oversight.

Mistake 6 · Training the wrong way

"AI awareness" webinars don't move the needle. **Role-specific, task-specific training** does. A marketer needs to know how to use AI for campaign briefs, not the history of transformer architectures. Grant Thornton's 2026 survey found training is the single most underfunded area of AI investment — 34% of finance leaders admit it isn't getting enough.

Mistake 7 · Expecting ROI in Week 2

AI models need a calibration period. Your team needs time to adapt workflows. Your data needs cleanup. Plan for a **3-to-6-month calibration window** where outputs improve as both the model and the humans using it get better at the job. ROI typically materializes in months 4–9, not week 2.

THE META-MISTAKE

Treating AI like software. You buy software, install it, use it. AI is closer to hiring — you onboard it, train it on your context, supervise it during probation, and gradually expand its autonomy as it proves competent. Organizations that adopt this mental model consistently outperform those that treat AI as plug-and-play.

The failure warning signs

If any of these describe your AI initiative, pause and recalibrate:

- You can't state, in one sentence, what business outcome you're chasing.
- You're running 5+ pilots simultaneously.
- The people using the AI tool weren't part of choosing it.
- You have no baseline metric to compare results against.

- You have no written "kill criteria" — no defined version of "this didn't work."
- Your leadership team doesn't personally use the AI tools they're mandating.

CHAPTER 07

Governance, Security & Risk

The boring part that separates organizations that scale AI from organizations that quietly get fired for losing customer data. Here's the minimum viable governance framework for 2026.

Why governance matters more in 2026

Three forces make governance non-optional now:

- **Regulatory pressure.** The EU AI Act is in force. ISO/IEC 42001 (AI Management System standard) is being adopted by enterprise buyers as a vendor requirement. In North America, regulators are following.
- **Data leak reality. 67% of executives** report their company has suffered a data leak through unapproved AI tools. Shadow AI isn't hypothetical — it's happening in your organization right now.
- **Agent proliferation. 97% of executives** report their company has deployed AI agents in the past year. Only **20%** have a tested incident response plan for when agents fail.

The 6-Point Minimum Governance Checklist

1. **Data classification policy.** Define what data can and cannot be fed to external AI systems. Typical tiers: Public (OK for any AI), Internal (OK for enterprise-grade AI with DPA in place), Confidential (internal AI only), Restricted (no AI, ever).
2. **Approved tools list.** Every AI tool used in the organization is explicitly approved, with a signed Data Processing Agreement. Employees using unapproved tools is grounds for discipline — and it must be clearly communicated.
3. **Human-in-the-loop rules.** Document which decisions require human approval. Typical pattern: high-risk decisions (termination, refund > $X, contract signing) always human. Medium-risk decisions (customer responses, internal memos) human review for first 30 days. Low-risk (internal drafts, research) autonomous with spot-check.
4. **Audit logging.** Every AI decision that affects a customer or employee should be logged: what

The Human Oversight Matrix

Use this to decide the level of human review required for each AI workflow.

DECISION TYPE	EXAMPLES	OVERSIGHT LEVEL
High-risk	Hiring, firing, loan/credit decisions, legal contracts, medical, refunds over threshold	Human decides — AI advises only
Medium-risk	Customer-facing emails, marketing copy, sales outreach, internal policy updates	Human reviews every output for first 30 days, then sample review
Low-risk	Internal research, brainstorming, meeting prep, first-draft writing, summarization	Autonomous with periodic spot-check
Audit-only	Log analysis, data cleaning, internal analytics, knowledge retrieval	Logs reviewed monthly; no per-decision oversight

Security Non-Negotiables for 2026

- **Enterprise AI, not consumer AI, for business data.** Free ChatGPT doesn't have the enterprise controls your data needs. Enterprise tiers (ChatGPT Enterprise, Claude for Teams, Microsoft Copilot) include Data Processing Agreements, data-use guarantees, and admin controls.
- **Single sign-on (SSO) and role-based access.** Every AI tool tied to your identity system. When someone leaves, their AI access dies with their email account.
- **No consumer-grade AI on customer data.** Full stop. If an employee pastes customer PII into a free AI tool, that's a breach.
- **Regular red-teaming.** Have someone try to make your AI agents misbehave quarterly. Prompt injection, data exfiltration attempts, edge cases. Fix what breaks.
- **Vendor AI due diligence.** When you buy software in 2026, assume it has AI agents embedded. Ask every vendor: what data is your AI trained on, what data do you retain, what happens if your AI makes a mistake that costs us money?

CHAPTER 08

How IMAGENN.ai Helps

Reading a playbook is step one. Acting on it is step two. Here's where we fit — and how to engage us when you're ready.

What we do

IMAGENN.ai helps organizations go from AI curiosity to AI outcomes — without the wasted budget, failed pilots, and governance gaps that defined 2024–2025.

We partner with organizations at three stages:

STAGE 1

Readiness & Strategy

5-pillar assessment, use-case prioritization, 90-day plan, executive alignment workshops.

STAGE 2

Pilot & Deploy

Tool selection, workflow design, integration, training, human-in-the-loop rollout.

STAGE 3

Scale & Govern

Governance frameworks, multi-workflow scaling, team enablement, quarterly reviews.

How we're different

- **Outcomes-first engagements.** Every project opens with a business target. If we can't tie work to revenue, cost, or time saved, we don't take the engagement.
- **Short, sharp timelines.** Our standard engagement is 90 days to three working workflows. No 12-month transformations that deliver nothing.
- **Enablement, not dependency.** We train your team so you own the capability. Our exit criterion is that you don't need us anymore.
- **Governance built in.** Every workflow we deploy ships with human-in-the-loop rules, audit logging, and an incident playbook. Not as an afterthought — as the default.

✓ WHO WE WORK BEST WITH

YOUR NEXT STEP

Stop reading about AI.
Start building with it.

Book a free 30-minute AI Readiness Assessment. We'll walk through your 5 pillars, identify your top 3 use cases, and send you a tailored 90-day plan — no obligation, no sales pitch.
